XC6101~XC6105, XC6111~XC6117 Series

Voltage Detector (V_{DF}=1.6V~5.0V)

■GENERAL DESCRIPTION

The XC6101~XC6105, XC6111~XC6117 series are groups of high-precision, low current consumption voltage detectors with manual reset input and watchdog functions incorporating CMOS process technology.   The series consist of a reference voltage source, delay circuit, comparator, and output driver.   With the built-in delay circuit, the XC6101 ~ XC6105, XC6111 ~ XC6117 series do not require any external components to output signals with release delay time.   Moreover, with the manual reset function, reset can be asserted at any time.   The ICs produce two types of output; V_{DFL} (low when detected) and V_{DFH} (high when detected). With the XC6101 ~ XC6105, XC6111 ~ XC6115 series, the WD pin can be left open if the watchdog function is not used.   Whenever the watchdog pin is opened, the internal counter clears before the watchdog timeout occurs. Since the manual reset pin is internally pulled up to the V_{IN} pin voltage level, the ICs can be used by leaving the manual reset pin unconnected if the pin is unused. The detect voltages are internally fixed 1.6V ~ 5.0V in increments of 0.1V, using laser trimming technology.   Six watchdog timeout periods are available in a range from 6.25ms to 1.6s. Seven release delay times are available in a range from 3.13ms to 1.6s.

■APPLICATIONS

● Microprocessor reset circuits
● Memory battery backup circuits
● System power-on reset circuits
● Power failure detection

■FEATURES

|	
Detect Voltage Range	: 1.6V ~ 5.0V, $\pm$2% (0.1V increments)
Hysteresis Width	: V_{DF} x 5%, TYP. (XC6101~XC6105) V_{DF} x 0.1%, TYP. (XC6111~XC6117)
Operating Voltage Range	: 1.0V ~ 6.0V
Detect Voltage Temperature Coefficient	: $\pm$100ppm/^{o}C (TYP.)
Output Configuration	: N-channel open drain, CMOS
Reset Output Options	: V_{DFL} (Low when detected) V_{DFH} (High when detected)
Watchdog Function	: Watchdog input WD; If it remains ether high or low for the duration of the watchdog timeout period, a reset is asserted.
Manual Reset Function	: Manual Reset Input MRB; When it changes from high to low, a reset is asserted.
Release Delay Time	: 1.6s, 400ms, 200ms, 100ms, 50ms, 25ms, 3.13ms (TYP.)
Watchdog Timeout Period	: 1.6s, 400ms, 200ms, 100ms, 50ms, 6.25ms (TYP.)
Operating Ambient Temperature	: -40°C~+85°C
Packages	: SOT-25, USP-6C
Environmentally Friendly	: EU RoHS Compliant, Pb Free

■TYPICAL APPLICATION CIRCUIT
* Not necessary with CMOS output products.

## ■TYPICAL PERFORMANCE CHARACTERISTICS

● Supply Current vs. Input Voltage
XC61X1~XC61X5 (2.7V)

* 'x' represents both '0' and '1'. (ex. XC61x1⇒XC6101 and XC6111)

■PIN CONFIGURATION

●SOT-25

**XC6101, XC6102 Series**

*4: XC6111~XC6117 (without hysteresis)
*5: Watchdog function is available.
*6: Watchdog function is not available.

■OPERATIONAL EXPLANATION

The XC6101~XC6105, XC6111~XC6117 series compare, using the amplifier, the voltage of the internal voltage reference source with the voltage divided by R1, R2 and R3 connected to the V_{IN} pin. The resulting output signal from the error amplifier activates the watchdog logic, manual reset logic, delay circuit and the output driver. When the V_{IN} pin voltage gradually falls and finally reaches the detect voltage, the RESETB pin output goes from high to low in the case of the V_{DFL} type ICs, and the RESET pin output goes from low to high in the case of the V_{DFH} type ICs.

<RESETB / RESET Pin Output Signal>
* V_{DFL} (RESETB) type - output signal: Low when detected.
The RESETB pin output goes from high to low whenever the V_{IN} pin voltage falls below the detect voltage, or whenever the MRB pin is driven from high to low. The RESETB pin remains low for the release delay time (t_{DR}) after the V_{IN} pin voltage reaches the release voltage. If neither rising nor falling signals are applied to the WD pin within the watchdog timeout period, the RESETB pin output remains low for the release delay time (t_{DR}), and thereafter the RESET pin outputs high level signal.

* V_{DFH} (RESET) type – output signal: High when detected.
The RESET pin output goes from low to high whenever the V_{IN} pin voltage falls below the detect voltage, or whenever the MRB pin is driven from high to low. The RESET pin remains high for the release delay time (t_{DR}) after the V_{IN} pin voltage reaches the release voltage. If neither rising nor falling signals are applied to the WD pin within the watchdog timeout period, the V_{OUT} pin output remains high for the release delay time (t_{DR}), and thereafter the RESET pin outputs low level signal.

<Hysteresis>
When the internal comparator output is high, the N-Channel transistor connected in parallel to R3 is turned ON, activating the hysteresis circuit. The difference between the release and detect voltages represents the hysteresis width, as shown by the following calculations:

V_{DF} (detect voltage) = (R1+R2+R3) x Vref(R2+R3)
V_{DR} (release voltage) = (R1+R2) x Vref(R2)
V_{HYS} (hysteresis width)=V_{DR}-V_{DF} (V)
V_{DR} > V_{DF}
* Detect voltage (V_{DF}) includes conditions of both V_{DFL} (low when detected) and V_{DFH} (high when detected).
* Please refer to the block diagrams for R1, R2, R3 and Vref.

Hysteresis width is selectable from V_{DF} x 0.05V (XC6101~XC6105) or V_{DF} x 0.001V (XC6111~XC6117).

<Watchdog (WD) Pin>
The XC6101~XC6105, XC6111~XC6117 series use a watchdog timer to detect malfunction or "runaway" of the microprocessor. If neither rising nor falling signals are applied from the microprocessor within the watchdog timeout period, the RESETB/RESET pin output maintains the detection state for the release delay time (t_{DR}), and thereafter the RESET/RESETB pin output returns to the release state (Please refer to the FUNCTION CHART). The timer in the watchdog is then restarted. Six watchdog timeout period settings are available in 1.6s, 400ms, 200ms, 100ms, 50ms, 6.25ms.

<MRB Pin>
Using the MRB voltage pin input, the RESET/RESETB pin signal can be forced to the detection state. When the MRB pin is driven from high to low, the RESETB pin output goes from high to low level signal in the case of the V_{DFL} type ICs, and the RESET pin output goes from low to high in the case of the V_{DFH} type. Even after the MRB pin is driven back high, the RESET/RESETB pin output maintains the detection state for the release delay time (t_{DR}). Since the MRB pin is internally pulled up to the V_{IN} pin voltage level, leave the MRB pin open if unused (Please refer to the FUNCTION CHART). A diode, which is an input protection element, is connected between the MRB pin and V_{IN} pin. Therefore, if the MRB pin is applied voltage that exceeds V_{IN}, the current will flow to V_{IN} through the diode. Please use this IC within the stated maximum ratings (V_{SS}-0.3~V_{IN}+0.3≦7.0V) on the MRB pin.

<Release Delay Time>
Release delay time (t_{DR}) is the time that elapses from when the V_{IN} pin reaches the release voltage, or when the watchdog timeout period expires with no rising signal applied to the WD pin, until the RESET/RESETB pin output is released from the detection state. Seven release delay time (t_{WD}) watchdog timeout period settings are available in 1.6s, 400ms, 200ms, 100ms, 50ms, 25ms, 3.13ms.
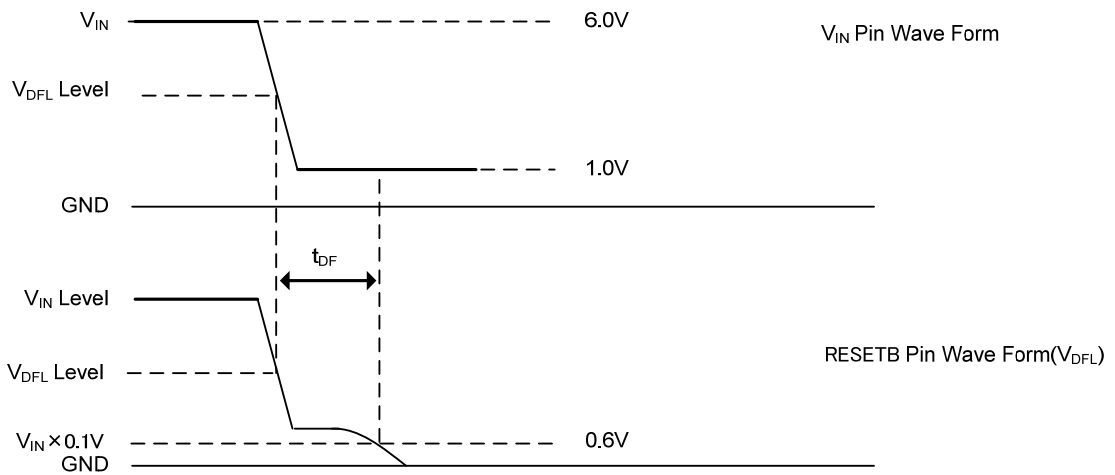

<Detect Delay Time>
Detect Delay Time (t_{DF}) is the time that elapses from when the V_{IN} pin voltage falls to the detect voltage until the RESET/RESETB pin output goes into the detection state.

●CMOS Output
*t_{DF}(CMOS output)

■NOTES ON USE

1. Please use this IC within the stated maximum ratings. For temporary, transitional voltage drop or voltage rising phenomenon, the IC is liable to malfunction should the ratings be exceeded.

2. When a resistor is connected between the V_{IN} pin and the input, the V_{IN} voltage drops while the IC is operating and a malfunction may occur as a result of the IC's through current.　For the CMOS output products, the V_{IN} voltage drops while the IC is operating and malfunction may occur as a result of the IC's output current.　Please be careful with using the XC6111~XC6117 series (without hysteresis).

3. In order to stabilize the IC's operations, please ensure that the V_{IN} pin's input frequency's rise and fall times are more than some μs/V.

4. Noise at the power supply may cause a malfunction of the watchdog operation or the circuit.　In such case, please strength the line between V_{IN} and the GND pin and connect about 0.22μF of a capacitor between the V_{IN} pin and the GND pin.

5. Protecting against a malfunction while the watchdog time out period, an ignoring time (no reaction time) occurs to the rise and fall times.　Referring to the figure below, the ignoring time (no reaction time) lasts for 900μs at maximum.

6. The watchdog function can be disabled by connecting a three-state device to the WDI pin as a result of the high impedance state of the WDI pin. This is effective when the watchdog function is not required, for example, during data loading to the CPU. The WDI input is internally driven through a buffer (LOGIC) and series resistor (R_{WD}) from the watchdog counter as showed in the block diagrams of page 4 and 5. The WDI input is designed for minimizing the input current by placing the series resistor (R_{WD}) in the maximum resistance of 880kΩ. A voltage drop occurs in proportion to the leakage current of the three-state device multiplied by the resistance value of the series resistor (R_{WD}) when the three-state device is in the state of high impedance. The voltage level must be reaching the threshold level of the WD so that a three-state device with small leakage current should be selected.

　　The other series is available in the name of XC6121~XC6124 with the ON/OFF control pin for the watchdog function. When these series is used, external parts such as the three-state device is not required.

7. Torex places an importance on improving our products and its reliability.
　However, by any possibility, we would request user fail-safe design and post-aging treatment on system or equipment.

●XC6104/XC61114, XC6105/XC6115 Series

V_{IN}	V_{WD}	V_{RESETB} [2]	V_{RESET} [3]
H	H	Repeat detect and release (H→L→H)	Repeat detect and release (L→H→L)
H	L		
H	Open	H	L
H	L → H		
H	H → L		
L	*1	L	H

●XC61116, XC6117 Series

V_{IN}	V_{MRB}	V_{RESETB} [2]	V_{RESET} [3]
H	H or Open	H	L
H	L	L	H
L			

*1: Including all logic of WD (V_{WD}=H, L, L→H, H→L, OPEN).
*2: When the V_{RESETB} is High, the circuit is in the release state.
   When the V_{RESETB} is Low, the circuit is in the detection state.
*3: When the V_{RESET} is Low, the circuit is in the release state.
   When the V_{RESET} is High, the circuit is in the detection state.
*4: V_{IN}=L and V_{MRB}=H can not be combined for the rated input voltage of the V_{MRB} pin is Vss-0.3V to V_{IN}+0.3V.
*5: The RESET/RESETB pin becomes indefinite operation while 0.35V<V_{MRB}<1.4V.

■TEST CIRCUITS

Circuit 1

100k Ω
(Unused for the CMOS output products)

Circuit 2

Circuit 3

V_{DS}=0.5V
When measuring leak
V_{RESETB}=0V (CMOS Output (Pch))
V_{RESETB}=6V (Nch Open Drain Output)

Circuit 4

VDS=0.5V
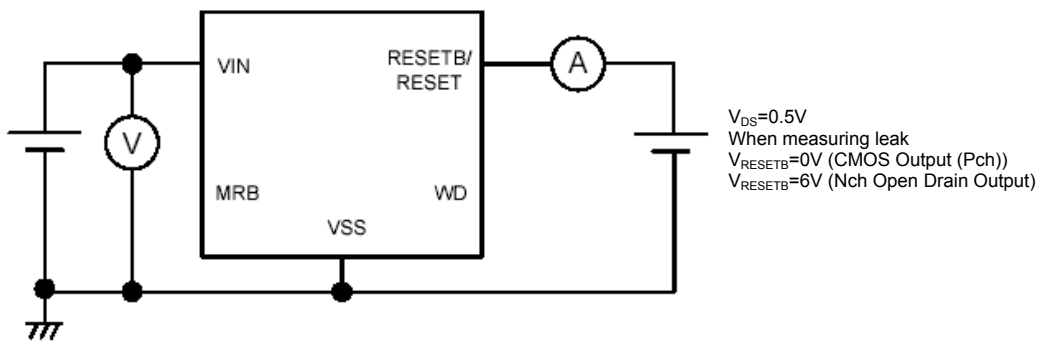

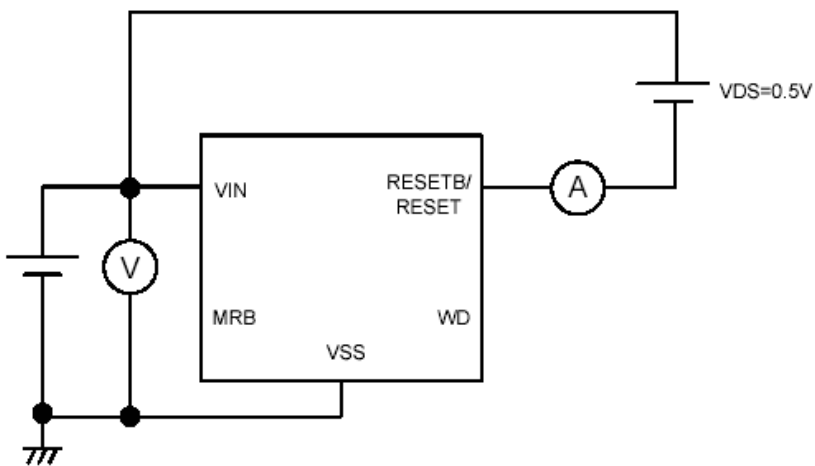

■TEST CIRCUITS (Continued)
Circuit 5

Circuit 6
Circuit 7
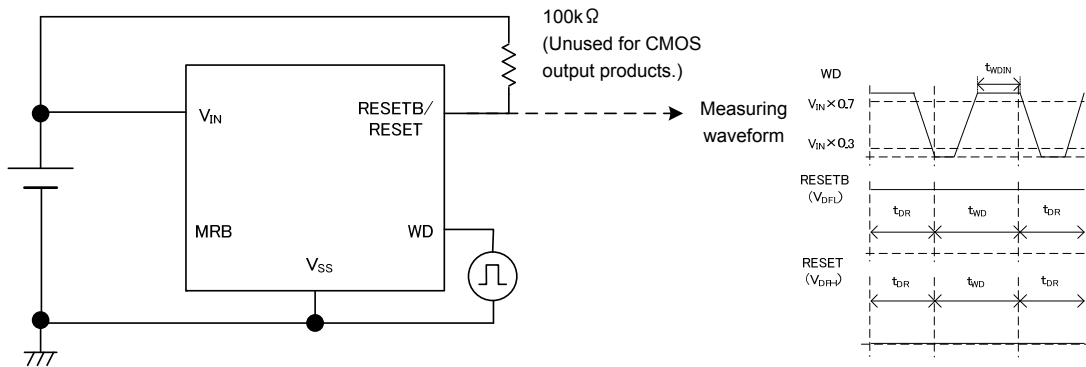

■TEST CIRCUITS (Continued)

Circuit 8

RWD=VIN/|IWD|

IWD(VWD=0V)

IWD(VWD=6V)

Circuit 9

100kΩ
(Not used when the CMOS
Output products selected.)

Circuit 10

RMR=VIN/|IMRB|

IMRB

Circuit 11

100kΩ
(Unused for CMOS
output products.)

Measuring
waveform

■TYPICAL PERFORMANCE CHARACTERISTICS

(1.1) Supply Current vs. Input Voltage
XC61X1~XC61X5 (1.6V)

XC61X1~XC61X5 (2.7V)

XC61X1~XC61X5 (5.0V)

(1.2) Supply Current vs. Input Voltage

XC6116, XC6117(1.6V)

XC6116, XC6117(2.7V)

* 'X' represents both '0' and '1'. (ex. XC61X1⇒XC6101 and XC6111)

■TYPICAL PERFORMANCE CHARACTERISTICS (Continued)

(1.2) Supply Current vs. Input Voltage (Continued)

XC6116, XC6117(5.0V)
(2) Detect, Release Voltage vs. Ambient Temperature

XC61X1~XC61X7 (1.6V)

XC61X1~XC61X7 (2.7V)
XC61X1~XC61X7 (5.0V)
* 'X' represents both '0' and '1'. (ex. XC61X1⇒XC6101 and XC6111)
■TYPICAL PERFORMANCE CHARACTERISTICS (Continued)

(3.1) Detect, Release Voltage vs. Input Voltage (V$_{DFL}$)
XC6101~XC6105(1.6V)

XC6101~XC6105(2.7V)

XC6101~XC6105(5.0V)

(3.2) Detect, Release Voltage vs. Input Voltage (V$_{DFH}$)

XC6103~XC6105(1.6V)

XC6103~XC6105(2.7V)

* 'X' represents both '0' and '1'. (ex. XC61X1⇒XC6101 and XC6111)

■TYPICAL PERFORMANCE CHARACTERISTICS (Continued)

(3.2) Detect, Release Voltage vs. Input Voltage (V$_{DFH}$) (Continued)

XC6103~XC6105(5.0V)

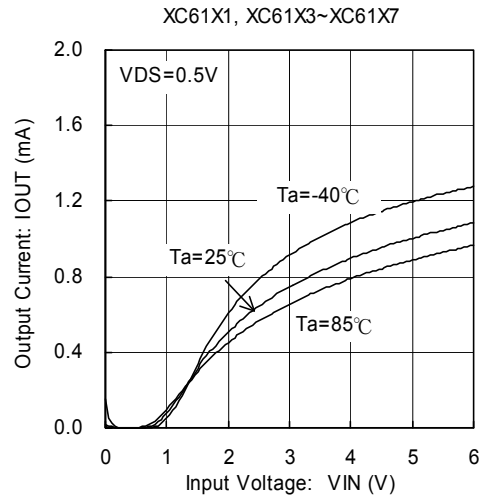

(4) N-ch Driver Output Current vs. V$_{DS}$

(5) N-ch Driver Output Current vs. Input Voltage

* 'X' represents both '0' and '1'. (ex. XC61X1⇒XC6101 and XC6111)

## ■TYPICAL PERFORMANCE CHARACTERISTICS (Continued)

(6) P-ch Driver Output Current vs. Input Voltage 1

XC61X1, XC61X3~XC61X7

(7) P-ch Driver Output Current vs. Input Voltage 2

XC61X1, XC61X3~XC61X7

(8) Release Delay Time vs. Ambient Temperature

XC61X1~XC61X7

XC61X1~XC61X7

XC61X1~XC61X7
* 'X' represents both '0' and '1'. (ex. XC61X1⇒XC6101 and XC6111)

■TYPICAL PERFORMANCE CHARACTERISTICS (Continued)

(9) Watchdog Timeout Period vs. Ambient Temperature

XC61X1~XC61X5

t_{WD}=6.25ms

WD Timeout Period t_{WD} (ms)

Ambient Temperature: Ta (℃)

XC61X1~XC61X5

t_{WD} =100ms

WD Timeout Period tWD (ms)

Ambient Temperature: Ta (℃)

XC61X1~XC61X5

t_{WD} =1.6s

WD Timeout Period t_{WD} (ms)

Ambient Temperature: Ta (℃)
(10) Release Delay Time vs. Input Voltage

(11) Watchdog Timeout Period vs. Input Voltage

XC61x1~XC61x7

Ta=25℃
t_{WD}=100ms

Release Delay Time t_{DR} (ms)

Input Voltage: VIN (V)

XC61x1~XC61x5

Ta=25℃
t_{WD}=100ms

WD Timeout Period t_{WD} (ms)
Input Voltage: VIN (V)

* 'X' represents both '0' and '1'. (ex. XC61X1⇒XC6101 and XC6111)

■TYPICAL PERFORMANCE CHARACTERISTICS (Continued)

(12) Watchdog Low Level Voltage vs. Ambient Temperature
XC61X1~XC61X5

(13) Watchdog High Level Voltage vs. Ambient Temperature

XC61X1~XC61X5

(14) MRB Low Level Voltage vs. Ambient Temperature

XC61X1~XC61X3, XC6116, XC6117

(15) MRB High Level Voltage vs. Ambient Temperature

XC61X1~XC61X3, XC6116, XC6117
* 'X' represents both '0' and '1'. (ex. XC61X1⇒XC6101 and XC6111)

1. The products and product specifications contained herein are subject to change without notice to improve performance characteristics. Consult us, or our representatives before use, to confirm that the information in this datasheet is up to date.

2. We assume no responsibility for any infringement of patents, patent rights, or other rights arising from the use of any information and circuitry in this datasheet.

3. Please ensure suitable shipping controls (including fail-safe designs and aging protection) are in force for equipment employing products listed in this datasheet.

4. The products in this datasheet are not developed, designed, or approved for use with such equipment whose failure of malfunction can be reasonably expected to directly endanger the life of, or cause significant injury to, the user.
    (e.g. Atomic energy; aerospace; transport; combustion and associated safety equipment thereof.)

5. Please use the products listed in this datasheet within the specified ranges.
    Should you wish to use the products under conditions exceeding the specifications, please consult us or our representatives.

6. We assume no responsibility for damage or loss due to abnormal use.

7. All rights reserved. No part of this datasheet may be copied or reproduced without the prior permission of TOREX SEMICONDUCTOR LTD.
