GENERAL DESCRIPTION
The XC6192 series are the Push Button load switch with functions best suitable for battery operated devices. The built-in high side switch is turned on by the Push Button (Turning off is also possible on the XC6192A type,) and turned off by the “L” level signal into the SHDN pin from the MCU or the like.
In addition to these functions, this IC is equipped with output capacitor inrush current limiting function and short-circuit protection function, realizing an intelligent load switch.
The high side switch is turned on and latched by inputting “L” signal from the Push Button of the device to the SW pin.
It is possible to shut down (OFF) by inputting a 1-pulse signal of “H” level from the MCU or the like to the SHDN pin. This realizes a main switch of battery operated devices easily. (*)
The leak current at shutdown is so small, which is 10nA(TYP.), that this IC will contribute to reducing the discharge of the battery and making shelf life longer of the devices after shipping as well as functioning as a main switch.
For the A type, it is possible to turn off forcibly in case of emergency by Push Button signal. This enables a freezed device to be turned off. For the B type, turn-off is available only with SHDN pin.
The output capacitor inrush current limiting function suppresses excessive current that occurs when the switch is turned on, preventing it from going into a brownout state.
The output short-circuit protection function detects the voltage drop due to the short circuit and turns off the power supply line by force. The "L" signal on the SW pin by Push button makes the device recover.
The power good function is used to properly adjust the timing of turning on the DC/DC regulator or other system on the rear stage.
(*) Please be sure to complete the preparation for shutting down safely before inputting the signal to SHDN pin from the MCU or the likes.
(*2) VOUT may not start up completely if the load current is 350uA (DC) or more at starting up due to the output capacitor inrush current limiting function. Please design so that the started up load current is less than 350uA (DC) or the output on the rear stage is enabled by using the PG pin.

APPLICATIONS
● Wearable devices
● Wireless headphones / Earphones
● Mobile devices
● Various applications equipped with buttons
● Various applications equipped with mechanical switches
● The devices with waterproof function.

FEATURES
Input Voltage Range : 2.5V ~ 6.0V
Stand-by Current : 0.01μA (TYP.) / Turn-Off state
Quiescent Current : 0.45μA (TYP.) / Turn-On state
Output Current : 400mA (VIN=2.5V, Ta=25℃)
Turn-On Delay Time (TOND) : 0.5s, 1.0s, 3.0s or 5s
Turn-Off Method : Type A ・By inputting “H” voltage to the SHDN pin.
・By inputting “L” voltage during the TOFFD to the SW pin.
Type B ・By inputting “H” voltage to the SHDN pin.
Turn-Off Delay Time (TOFFD) : 3s, 5s, 10s or 15s
Added function : Power Good function (the PG pin)
Protective function : Forced shutdown function (the SHDN pin)
Operating Ambient Temperature : -40℃ ~ 85℃
Package : USP-8B06

(*1) Please select freely according to the threshold of the MCU's I/O.
OPERATIONAL EXPLANATION

The XC6192 series A type fixes VOUT at “H” voltage (same level as the VIN pin voltage) when “L” voltage is input the required time into the SW pin, and shuts down VOUT (same level as GND) when “L” voltage is subsequently input the required time into the SW pin, thereby realizing alternating ON/OFF control(*1). Two shutdown methods are available: inputting “H” voltage into the SHDN pin, and inputting “L” voltage the required time into the SW pin.

(*1) Alternating ON/OFF control on this IC is a system that alternates between VOUT “H” voltage and shutdown each time “L” voltage is input the required time into the SW pin.

The B type fixes VOUT at “H” voltage when “L” voltage is input the required time into the SW pin. After VOUT is fixed at “H” voltage, the signal is not accepted if “L” voltage is subsequently input into the SW pin. The shutdown method is inputting “H” voltage into the SHDN pin.

As protective functions, the XC6192 series is equipped with a rush current prevention circuit and a short-circuit protection circuit.

Fig.1 XC6192A Block diagram

Fig.2 XC6192 Series Typical application circuit
OPERATIONAL EXPLANATION (Continued)

[Turn-On sequence: Fig.3]

On the XC6192 series, when “L” voltage is input for the duration $T_{OND}$ into the SW pin with $V_{OUT}$ fixed at “L” voltage, the Pch pre-driver transistor PM1 (Fig.1) turns ON and $V_{OUT}$ starts to rise. If the SW pin is switched from “L” voltage to “H” voltage while $V_{OUT}$ is rising by PM1, $V_{OUT}$ will change to the shutdown state.

When the $V_{OUT}$ pin voltage reaches Inrush Current Limit Voltage ($V_{RUSH}$; refer to Electrical Characteristics), the main driver transistor PM2 (Fig.1) turns ON, and $V_{OUT}$ is fixed at “H” voltage even if the SW pin voltage changes to “H” voltage.

When the $V_{OUT}$ pin voltage reaches $V_{RUSH}$, the Nch transistor NM1 that is connected to the PG pin (Fig.1) turns OFF and the PG pin changes to high impedance.

These operations suppress rush current to the capacitor that is connected to the $V_{OUT}$ pin and allow the input power supply to maintain stability. In addition, by connecting the PG pin to the Enable pin of the device that follows the XC6192 series, malfunctioning of that device is prevented. (Fig.2)
OPERATIONAL EXPLANATION (Continued)

[Shutdown sequence: Fig.4]
On the XC6192 series, when one pulse of “H” voltage (at least 1ms as a guideline) is input into the SDHN pin with V\text{OUT} \text{ fixed at} “H” voltage, V\text{OUT} changes to the shutdown state and the IC enters the standby state.

![Fig.4 shutdown sequence]

[Turn-Off sequence: Fig.5]
On the A type, when “L” voltage is input into the SW pin for the duration $\text{TOFFD}$ with V\text{OUT} \text{ fixed at} “H” voltage, V\text{OUT} shuts down. After shutdown, returning the SW pin to “H” voltage reduces the supply current to the standby current while holding the IC’s logic.

The B type does not have this function.

![Fig.5 Turn-Off sequence]
OPERATIONAL EXPLANATION (Continued)

[Operation after Turn-On: Fig. 6]
On the A type, when “L” voltage is input into the SW pin for the duration $T_{OND}$ and $V_{OUT}$ is fixed at “H” voltage, and then “L” voltage is input into the SW pin for the duration $T_{OFFD}$, the Turn-Off sequence cannot be initiated. To initiate the Turn-Off sequence, “H” voltage must be input into the SW pin, and then “L” voltage must again be input for the duration $T_{OFFD}$.
The B type does not have a Turn-Off sequence by SW pin.

[Operation after Turn-Off:Fig.7]
On the A type, when “L” voltage is input into the SW pin for the duration $T_{OFFD}$ and $V_{OUT}$ is shut down, and then “L” voltage is input into the SW pin for the duration $T_{OND}$, the Turn-On sequence cannot be initiated.
To initiate the Turn-On sequence, “H” voltage must be input into the SW pin, and then “L” voltage must again be input for the duration $T_{OND}$.
The B type does not have a Turn-Off sequence by SW pin.
OPERATIONAL EXPLANATION (Continued)

[Operation after shutdown: Fig. 8]

On the XC6192 series, in order to initiate the Turn-On sequence after “H” voltage is input into the SHDN pin and VOUT is shut down, “H” voltage must be input into the SW pin and then “L” voltage must again be input for the duration TOND.

Fig. 8 Operation after shutdown.
OPERATIONAL EXPLANATION (Continued)

[Inrush current limit and output short circuit protection: Fig.9]

The XC6192 series has a function that limits rush current and a circuit that shuts down the output when an output short-circuit is detected.

During the time until the V_OUT pin voltage reaches V_RUSH during the Turn-On sequence, only PM1 turns ON, and therefore the voltage rises through the Pre-driver On Resistor (RONP: refer to the Electrical Characteristics).

When the V_OUT pin voltage reaches V_RUSH or more, PM2 turns ON and rush current limiting is released.

The rush current at the instant when PM1 turns ON is calculated using the following equation.

\[ \text{Inrush Current} = \frac{V_IN}{RONP} \text{ (A)} \]

In addition, during the time until the V_OUT pin voltage reaches V_RUSH by means of the rush current limiting function, the load current while V_OUT rises must be set to less than the value given by the equation below.

**Start-up Load Current < \( \frac{(V_IN - V_{RUSH (Max.)})}{RONP} \text{ (A)} \)**

Example: 4.2V – 4.15V / 135 Ohms = 0.359mA;
Note this very low 0.359mA is used to charge the output capacitors. If startup load current exceeds this, the output current will pass thru PM1 only, and have a 135 ohm resistor creating a voltage drop. If it’s noticed that V_OUT is significantly below V_IN, please ensure start-up load current is NOT exceeded.

If the V_OUT pin voltage drops below the Short Circuit Detect Voltage (V_SHORT: refer to the Electrical Characteristics) after the Turn-On sequence, a short-circuit is detected and PM1 and PM2 are latched in the OFF state, causing V_OUT to shut down. The relation between the output current (I_SHORT) and V_SHORT when a short circuit occurs is given by the equation below.

\[ I_{\text{short}} = \frac{(V_IN - V_{\text{short}})}{RON} \text{ (A)} \]

The equation for the maximum output current is as follows.

\[ I_{\text{OUT (Min.)}} = \frac{(V_IN - V_{\text{SHORT (Max.)}})}{RON (Max.)} \text{ (A)} \]

---

**Fig.9 Output capacitor inrush current limit and output short circuit protection**
OPERATIONAL EXPLANATION (Continued)

[SW pin]
When "L" voltage is input into the SW pin for the duration $T_{OND}$ with the IC in the standby state, the pin fixes $V_{OUT}$ at "H" voltage.
On the A type, when $V_{OUT}$ is fixed at "H" voltage, "L" voltage can be input for the duration $T_{OFFD}$ to shut down $V_{OUT}$.

[SHDN pin]
This pin shuts down $V_{OUT}$ when one pulse of "H" voltage (1ms or more as a guideline) is input into the SHDN pin with $V_{OUT}$ fixed at "H" voltage.

[PG pin]
NM1 and R2 (Fig.1) are connected to the PG pin.
NM1 is an Nch MOSFET and is synchronized with the GATE signal of PM2, so NM1 turns OFF when PM2 turns ON.

[VOUT pin]
PM1, PM2, and R1 (Fig.1), and R2 (Fig.1) and the CL discharge transistor NM2 (Fig.1) are connected to the output pin.
PM1 is a Pch MOSFET, and is effective in preventing rush current.
PM2 is a Pch MOSFET and functions as the main driver.
NM2 is an Nch MOSFET, and is synchronized with the GATE signal of PM1. Therefore, when PM1 turns ON, NM2 turns OFF.

[SW Circuit]
This circuit transmits the signal input into the SW pin to the internal circuitry.

[SHDN Circuit]
This circuit transmits the signal input into the SHDN pin to the internal circuitry.

[VREF & POR]
This circuit supplies the internal circuit reference voltage and is a reset circuit that is input into the logic circuitry.

[Type Select]
This circuit selects the product type.

[Turn-On Delay Counter]
This circuit count-controls the time until $V_{OUT}$ is fixed at "H" voltage after "L" voltage is input into the SW pin.
During the time until the count is completed, the counter circuit can be returned to the initial state by inputting "H" voltage into the SW pin.

[Turn-Off Delay Counter]
This circuit only operates on the A type.
When $V_{OUT}$ is fixed at "H" voltage, this circuit count-controls the time from input of "L" voltage into the SW pin until $V_{OUT}$ shuts down.
During the time until the count is completed, the counter circuit can be returned to the initial state by inputting "H" voltage into the SW pin.

[VREF2 & POR2]
This circuit sets the initial state of the $V_{OUT}$ pin.
The circuit is set so that $V_{OUT}$ is in the shutdown state when the power is turned on, so there is no need to input "H" voltage into the SHDN pin after power is supply to shut down the output.

[Inrush Current Limit]
This circuit limits rush current until the $V_{OUT}$ pin voltage reaches $V_{RUSH}$.

[Short Circuit Protect]
This circuit outputs a shutdown signal if the $V_{OUT}$ pin voltage reaches $V_{SHORT}$.

[Gate Slope]
After the $V_{OUT}$ pin voltage reaches $V_{RUSH}$, this circuit gradually changes the GATE voltage of PM2 from "H" voltage to "L" voltage.
1) For temporary, transitional voltage drop or voltage rising phenomenon. The IC is liable to malfunction should the ratings be exceeded.

2) Please use this IC within the specified operating ranges.

3) In some cases, power supply noise may cause malfunctioning of the internal counter circuit. Sufficiently reinforce the \( V_{IN} \), \( V_{OUT} \), and GND lines, and connect 0.1 \( \mu \)F or higher capacitors near the IC between \( V_{IN} \) and GND (\( V_{SS} \)), and between \( V_{OUT} \) and GND (\( V_{SS} \)).

4) Turn-On Delay Time characteristics and Turn-Off Delay Time characteristics are increased when using a capacitor larger than 0.1 \( \mu \)F for CL connected to \( V_{OUT} - GND (V_{SS}) \). Sufficiently test actual operation before use.

5) When “L” level is input into the SW pin, Operation Current flows. Sufficiently test actual operation before designing peripheral circuits.

6) The SW pin and SHDN pin are connected to the gate of a CMOS inverter. If a voltage lower than the \( V_{IN} \) pin voltage or a voltage higher than the \( V_{SS} \) pin voltage is input into each pin, the flow-through current of the CMOS inverter may appear as supply current.

7) If an intermediate voltage between “L” voltage and “H” voltage is input into the SW pin or SHDN pin, starting and stopping of the IC may become unstable. Sufficiently test peripheral components and other parts to ensure that an intermediate voltage between “L” voltage and “H” voltage is not continuously input for an excessive time into the SW pin and SHDN pin.

8) The TEST pin must be connected to GND (\( V_{SS} \)).

9) When using for an application other than a push-button application, please design the timing to include deviations and test sufficiently with the actual device before use.

10) The USP-8B06 is a thin surface-mount package. Therefore, distortion of the board during PCB mounting may be transmitted to the IC chip, which may affect Turn-On Delay Time characteristics and Turn-Off Delay Time characteristics. Sufficiently test actual operation before use.

11) Torex places an importance on improving our products and their reliability. We request that users incorporate fail-safe designs and post-aging protection treatment when using Torex products in their systems.
TYPICAL PERFORMANCE CHARACTERISTICS

(1) Standby Current vs. Input Voltage

* No character inversion used.
1. The product and product specifications contained herein are subject to change without notice to improve performance characteristics. Consult us, or our representatives before use, to confirm that the information in this datasheet is up to date.

2. The information in this datasheet is intended to illustrate the operation and characteristics of our products. We neither make warranties or representations with respect to the accuracy or completeness of the information contained in this datasheet nor grant any license to any intellectual property rights of ours or any third party concerning with the information in this datasheet.

3. Applicable export control laws and regulations should be complied and the procedures required by such laws and regulations should also be followed, when the product or any information contained in this datasheet is exported.

4. The product is neither intended nor warranted for use in equipment of systems which require extremely high levels of quality and/or reliability and/or a malfunction or failure which may cause loss of human life, bodily injury, serious property damage including but not limited to devices or equipment used in 1) nuclear facilities, 2) aerospace industry, 3) medical facilities, 4) automobile industry and other transportation industry and 5) safety devices and safety equipment to control combustions and explosions. Do not use the product for the above use unless agreed by us in writing in advance.

5. Although we make continuous efforts to improve the quality and reliability of our products; nevertheless Semiconductors are likely to fail with a certain probability. So in order to prevent personal injury and/or property damage resulting from such failure, customers are required to incorporate adequate safety measures in their designs, such as system fail safes, redundancy and fire prevention features.

6. Our products are not designed to be Radiation-resistant.

7. Please use the product listed in this datasheet within the specified ranges.

8. We assume no responsibility for damage or loss due to abnormal use.

9. All rights reserved. No part of this datasheet may be copied or reproduced unless agreed by Torex Semiconductor Ltd in writing in advance.
