

## Inductor Built-in Inverting “micro DC/DC” Converters

☆GreenOperation Compatible

### ■GENERAL DESCRIPTION

The XCL301 series is a inverting micro DC/DC converter which integrates a P-channel FET, an inductor and a control IC in one tiny package (2.5mm × 2.0mm, H=1.00mmMAX). A wide operating voltage range of 2.7V to 5.5V enables support for applications that require an internally -3.3V fixed output voltage.

The XCL301 series uses automatic PFM/fixed off time PWM. In automatic PFM/fixed off time PWM control, the IC operates by PFM control when the load is light to achieve high efficiency over the full load range from light to heavy. The device provides a stable inverting power supply to be configured using only a SBD and two capacitors connected externally.

During stand-by, all circuits are shutdown to reduce current consumption to as low as 0.1μA (TYP) or less. With the built-in UVLO (Under Voltage Lock Out) function, the internal P-channel MOS driver transistor is forced OFF when input voltage becomes 2.2V or lower. The XCL301 integrate C<sub>L</sub> High Speed discharge function which enables the electric charge at the output capacitor C<sub>L</sub> to be discharged via the internal discharge.

### ■APPLICATIONS

- Negative power supply for AMP
- Negative power supply for LCD
- Negative power supply for CCD
- General purpose Negative power supply

### ■FEATURES

Input Voltage Range	:	2.7V~5.5V
Output Voltage	:	-3.3V
Output Voltage accuracy	:	±2.0%
Output Current	:	-50mA@V <sub>OUT</sub> =-3.3V, V <sub>IN</sub> =3.3V (TYP)
Internal Driver	:	1.3Ω (Pch Driver Tr)
Quiescent Current	:	40μA (TYP.)
Control Methods	:	PFM / Fixed off time PWM Auto
Transient Response	:	-50mV (V <sub>IN</sub> =3.3V, V <sub>OUT</sub> =-3.3V, I <sub>OUT</sub> =1mA→50mA)
PFM switch Current Function	:	550mA Current Limit Soft-Start CL High Speed Discharge UVLO CL High Speed Discharge
Operating Ambient Temperature	:	-40~+85°C
Packages	:	CL-2025-02
Environmentally Friendly	:	EU RoHS Compliant, Pb Free

## ■ PRODUCT CLASSIFICATION

### ● Ordering Information

XCL301①②③④⑤⑥-⑦

DESIGNATOR	ITEM	SYMBOL	DESCRIPTION
①	Product Type	A	Refer to Selection Guide
②③	Output Voltage	33	Output Voltage = -3.3V only
④	PFM Switch Current	1	550mA (TYP.)
⑤⑥-⑦ (*1)	Packages (Order Unit)	ER-G	CL-2025-02 (3,000pcs/Reel)

(\*1) The "-G" suffix denotes Halogen and Antimony free as well as being fully EU RoHS compliant.

### ● Selection Guide

TYPE	OUTPUT VOLTAGE	CL DISCHARGE	UVLO	CHIP ENABLE
A	-3.3V Fixed	Yes	Yes	Yes

## ■ PIN CONFIGURATION

(BOTTOM VIEW)

\* The dissipation pad should be solder-plated in recommended mount pattern and metal masking so as to enhance mounting strength and heat release. If the pad needs to be connected to other pins, it should be connected to the GND (No. 5) pin. NC (No.3) doesn't connect to IC chip.

## ■ PIN ASSIGNMENT

PIN NUMBER	PIN NAME	FUNCTIONS
CL-2025-02		
1	L <sub>X</sub>	Switching Output
2	V <sub>OUT</sub>	Output Voltage
3	NC	No Connection
4	CE	Chip Enable
5	GND	Ground
6	V <sub>IN</sub>	Power Input
7	L1	Inductor Electrodes
8	L2	Inductor Electrodes

## ■ FUNCTION

PIN NAME	SIGNAL	STATUS
CE	H	Operation
	L	Standby

\* Please do not leave the CE pin open.

## ■ ABSOLUTE MAXIMUM RATINGS

T<sub>a</sub>=25°C

PARAMETER	SYMBOL	RATINGS	UNITS
V <sub>IN</sub> Pin Voltage	V <sub>IN</sub>	-0.3 ~ +6.0	V
L <sub>X</sub> Pin Voltage	V <sub>LX</sub>	V <sub>IN</sub> -13.0 ~ V <sub>IN</sub> +0.3 or +6.0 <sup>(*)1</sup>	V
V <sub>OUT</sub> Pin Voltage	V <sub>OUT</sub>	V <sub>IN</sub> -22.0 ~ V <sub>IN</sub> +0.3 or +6.0 <sup>(*)1</sup>	V
CE Pin Voltage	V <sub>CE</sub>	-0.3 ~ +6.0	V
L <sub>X</sub> Pin Current	I <sub>LX</sub>	1500	mA
Power Dissipation	P <sub>d</sub>	1000(40mm×40mm, t=1.6mm, FR-4) <sup>(*)2</sup>	mW
Operating Ambient Temperature	T <sub>opr</sub>	-40 ~ +85	°C
Storage Temperature	T <sub>stg</sub>	-55 ~ +125	°C

\* All voltages are described based on the GND pin.

<sup>(\*)1</sup> The maximum value should be either V<sub>IN</sub> +0.3V or +6.0V in the lowest.

<sup>(\*)2</sup> The value of power dissipation varies with the mount board (40mm×40mm, FR-4) conditions.

## TYPICAL APPLICATION CIRCUIT

### 【Typical Examples】

	MANUFACTURE	PRODUCT NUMBER	VALUE
C <sub>IN</sub>	TAIYO YUDEN	LMK105CBJ106MVLF	10µF/10V
C <sub>L</sub>	TAIYO YUDEN	LMK105CBJ106MVLF×2	10µF/10V
SD	PANJIT	SBA240CH	2A/40V

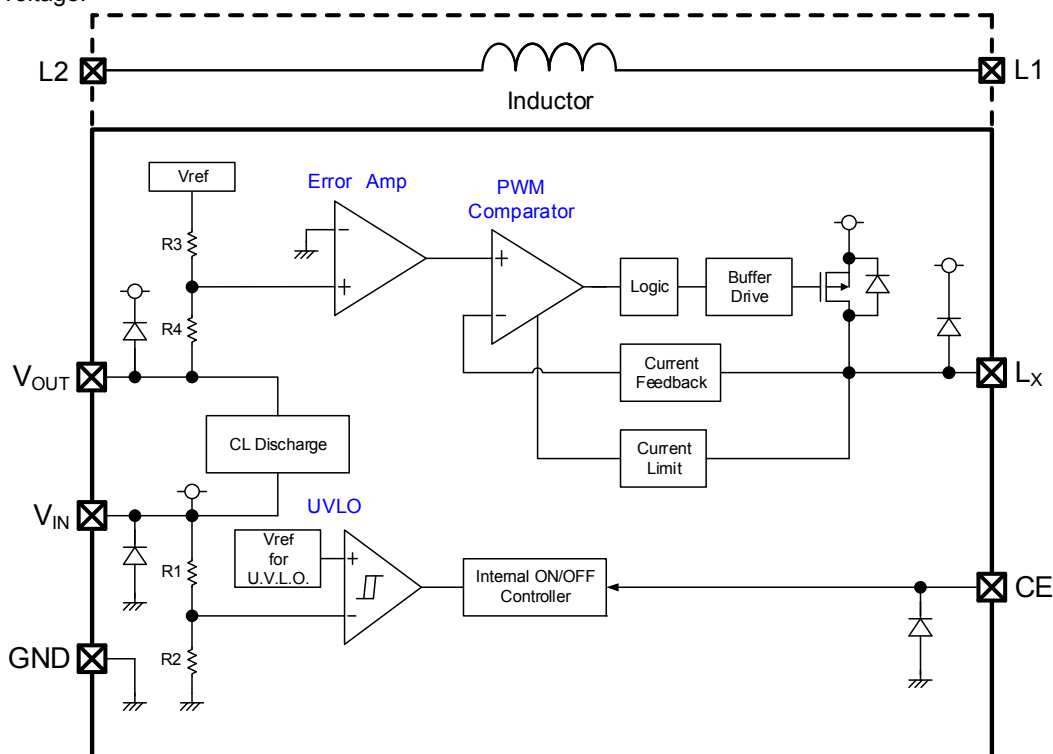

\* Take capacitance loss, withstand voltage, and other conditions into consideration when selecting components.

\* Recommend 20µF for C<sub>L</sub> Value.

\* If a tantalum or electrolytic capacitor is used for the load capacitance C<sub>L</sub>, ripple voltage will increase, and there is a possibility that operation will become unstable. Test fully using the actual device.

## ■ OPERATIONAL EXPLANATION

The XCL301 series consists of a reference voltage source, error amplifier, PWM comparator, output voltage adjustment resistance, P-ch MOS driver transistor, current limiting circuit, UVLO circuit, and other components (refer to the block diagram). The internal reference voltage and the feedback voltage from the  $V_{OUT}$  pin that passes through R3 and R4 are compared by the error amplifier and a signal that determines the on time for switching during PWM operation is generated. A current feedback circuit detects the current of the P-ch MOS driver transistor at each switching and generates a current feedback signal. The PWM comparator compares the signal generated by the error amplifier and the current feedback signal, sends the output to the buffer drive circuit, and this is output from the  $L_x$  pin as the on time of switching. The off time of PWM operation is fixed inside the IC, and the P-ch MOS driver transistor is turned on after the fixed time elapses. This operation is performed continuously to stabilize the output voltage.

XCL301 Series

### <Vref>

Reference voltage that acts as the reference used to stabilize the output voltage of this IC.

### <Error Amp.>

The error amplifier is designed to monitor the output voltage. The voltage divided by the internal R3 and R4 resistances is fed back and compared to the reference voltage. In response to feedback of a voltage higher than the reference voltage, the output voltage of the error amplifier increases. The frequency characteristics of the error amplifier are optimized internally.

### <Current Feedback>

Detects the current of the P-ch MOS driver transistor at each switching and generates a current feedback signal.

### <PWM Comparator>

The signal generated by the error amplifier and the current feedback signal are compared, and when the signal generated by the error amplifier is lower, a signal that turns the driver transistor off is output.

### <Buffer Drive>

Outputs the signal that drives the P-ch MOS driver transistor.

## OPERATIONAL EXPLANATION (Continued)

### <Current Limit>

The current limiting circuit of the XCL301 series monitors the current that flows through the P-ch MOS driver transistor that is connected to the L<sub>x</sub> pin and limits the current.

(1) If the driver current is higher than a specific current, the current limiting function activates and turns off the pulse that is output

from the L<sub>x</sub> pin at any selected timing.

(2) The driver transistor remains off until the inductor current becomes 0A.

(3) The P-ch MOS driver transistor turns on at the timing of the next pulse, however, if there is over-current at this time, the P-ch MOS driver transistor turns off immediately.

(4) When the over-current state no longer exists, normal operation takes place.

While repeating (1) to (3), the IC waits for the over-current state to stop.

### <UVLO>

To prevent incorrect pulse output due to instable operation of the internal circuitry when the V<sub>IN</sub> pin voltage drops below 2.2V (TYP.), the driver transistor is forcibly turned off. When the V<sub>IN</sub> pin voltage rises higher than 2.35V (TYP.), switching operation is performed. When the UVLO function is canceled, the soft-start function activates and output start operation begins. Soft-start also operates if the V<sub>IN</sub> pin momentarily drops below the UVLO operation voltage. The UVLO function only stops pulse output; it does not shut down the IC and thus the internal circuitry continues to operate.

### <PFM Switch Current>

During PFM operation, the P-ch MOS driver transistor is on until the current flowing through the inductor reaches a specific value

(I<sub>PFM</sub>). This P-ch MOS driver transistor on time (t<sub>ON</sub>) is determined by the following equation:

$$t_{ON} = L \times I_{PFM} / V_{IN}$$

Fig. PFM Current

## ■ OPERATIONAL EXPLANATION (Continued)

### < C<sub>L</sub> Auto Discharge >

The XCL301 series allows high-speed discharge of the output capacitor (C<sub>L</sub>) through the IC internal C<sub>L</sub> discharge resistance when an L level signal is input into the CE pin (when the IC is in the standby state). This makes it possible to prevent application malfunctioning due to a charge remaining on C<sub>L</sub> when the IC is stopped. The discharge time is determined by the C<sub>L</sub> discharge resistance and C<sub>L</sub>.

$$t = -\tau \ln \left( \frac{V_{IN}-V}{V_{IN}-V_{OUT(T)}} \right)$$

V: Output voltage after discharge

V<sub>OUT(T)</sub>: Nominal output voltage

t: Unit: mm

Discharge time

$$\tau = C_L \times R_{DCHG}$$

C<sub>L</sub>: Capacitance of output capacitor

R<sub>DCHG</sub>: C<sub>L</sub> auto-discharge resistance

### <CE Pin Function>

The XCL301 series can be put in the shutdown state by L level input to the CE pin. In the shutdown state, the supply current of the IC is 0 μA (TYP.). Operation is started by inputting H level to the CE pin. The CE pin input is CMOS input and the sink current is 0 μA (TYP.).

### <The rise operation>

The rise time is determined by the input voltage, output voltage, output capacitance, and soft-start current limit (I<sub>LIMSS</sub>).

- (1) When the CE pin is turned on, the driver transistor turns on.
- (2) When the driver current exceeds the soft-start current limit value, the driver transistor is turned off.
- (3) The driver transistor remains off until the inductor current becomes 0A.
- (4) When the inductor current becomes 0A, the driver transistor is turned on again.
- (5) If the output voltage is larger than setting voltage, the operations of (2) to (5) are repeated.
- (6) When the output voltage becomes smaller than setting voltage, operation starts in PFM/fixed off-time PWM control.

## NOTE ON USE

1. Be careful not to exceed the absolute maximum ratings for externally connected components and this IC.
2. The DC/DC converter characteristics greatly depend not only on the characteristics of this IC but also on those of externally connected components, so refer to the specifications of each component and be careful when selecting the components. Be especially careful of the characteristics of the capacitor used for the load capacity  $C_L$  and use a capacitor with B characteristics (JIS Standard) or an X7R/X5R (EIA Standard) ceramic capacitor.
3. Wire external components as close to the IC as possible and use thick, short connecting traces to reduce the circuit impedance.
4. Mount the externally connected components in the vicinity of the IC. Also use short, thick wires to reduce the wire impedance.
5. When the input voltage is high or the ambient temperature is low temperature, there is a case that the coil current at the time of rise is superimposed and the inrush current becomes larger than 700 mA  
Please test fully using the actual device before use. (See the figure below)

6. Ripple voltage will be if both the input voltage is high and the ambient temperature is low. Once the design has been completed, verification with actual components should be done. (Please refer to below)

$V_{IN}=5.5V, V_{OUT}=-3.3V, I_{OUT}=50mA, T_a=-40^{\circ}C$

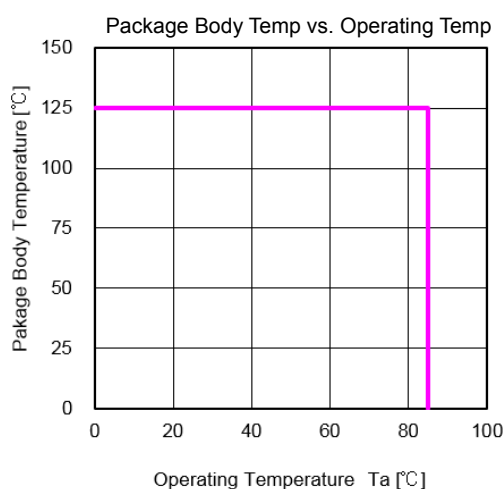

7. Use of the IC at voltages below the recommended voltage range may lead to instability.
8. In case load current (resistance load) is large when rising, output voltage may not reach the setting voltage. Once the design has been completed, verification with actual components should be done.
9.  $C_L$  discharge function may end even if more than 10% output voltage remains at the following conditions: CE pin=L with lower than 3V input voltage, or input voltage is lower than UVLO detection voltage. <sup>(\*)</sup>
10.  $C_L$  discharge function may not work under any of the following conditions:  
When the voltage at the CE pin is turned Low level, following a situation when the output voltage never reached less than -3V despite the voltage at the CE pin was turned high level.  
With the CE pin connected to  $V_{IN}$ , when the  $V_{IN}$  voltage drops below the UVLO detect voltage, following a situation when the output voltage never reached less than -3V despite the input voltage rise above the UVLO release voltage. <sup>(\*)</sup>

<sup>(\*)</sup> "H"=1.2V~5.5V、 "L"=GND~0.4V

## NOTE ON USE (Continued)

11. If the output is short-circuited, the IC internal power dissipation may exceed the power dissipation specified in the data sheet even if the inductor current does not reach the maximum current limit.
12. When the input voltage is high or the ambient temperature is low, the coil current may be superimposed and the maximum current limit value may exceed 1300 mA. This may cause the possibility of exceeding the rated current of the IC, coil and schottky diode in some cases. Please test fully using the actual device before use.
13. For temporary, transitional voltage drop or voltage rising phenomenon, the IC is liable to malfunction should the ratings be exceeded.
14. Torex places an importance on improving our products and their reliability.  
We request that users incorporate fail-safe designs and post-aging protection treatment when using Torex products in their systems.
15. Please use within the power dissipation range below. Please also note that the power dissipation may be changed by test conditions, the power dissipation figure shown is PCB mounted.

The power loss of micro DC/DC according to the following formula:

$$\text{Power loss} = V_{\text{OUT}} \times I_{\text{OUT}} \times ((100/\text{EFFI}) - 1) \text{ (W)}$$

$V_{\text{OUT}}$ : Output Voltage (V)

$I_{\text{OUT}}$ : Output Current (A)

EFFI: Conversion Efficiency (%)

## NOTES ON LAYOUT

1. In order to stabilize  $V_{IN}$  voltage level, we recommend that a by-pass capacitor ( $C_{IN}$ ) be connected as close as possible to the  $V_{IN}$  & GND pins.
2. Please mount each external component as close to the IC as possible.
3. Wire external components as close to the IC as possible and use thick, short connecting traces to reduce the circuit impedance.
4. Make sure that the PCB GND traces are as thick as possible, as variations in ground potential caused by high ground currents at the time of switching may result in instability of the IC.
5. This series' internal driver transistors bring on heat because of the output current and ON resistance of P-ch MOS driver transistors.
6. As precautions on mounting, please set the mounting position accuracy within 0.05 mm.
